

Innerliner - Metallised

DESCRIPTION

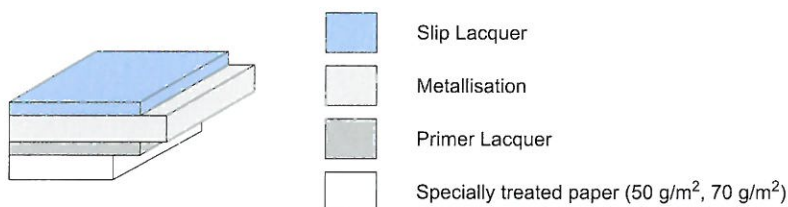

Metallised paper for the innerliner of cigarette packets is produced by metallising technology which is the coating of an aluminium layer on specially treated paper. The surface of the metallised paper is coated by a slip lacquer giving good performance in high-speed automated packing machines. The surface of the metallised paper can be embossed in automated packing machines during the packing cigarettes process.

TYPICAL APPLICATION

- The Innerliner of the cigarette packets.

STANDARD MANUFACTURED DIMENSIONS

Laminate composition:

For deliveries of any modifications of the products listed in our product specification please contact one of our Key Account Managers to discuss your individual needs.
